

MICOR 9

MICOR 9[®] is a concentrate of Endo and Ectomycorrhizae. For every liter of product has a guaranteed minimum concentration of 8×10^{11} CFU (colony forming units) of Endomycorrhizae and 7×10^{11} CFU of Ectomycorrhizae. These associations are another mechanism by which mycorrhizae help control root diseases.

Mycorrhizae feed the soil trophic network to be consumed mainly by worms, insects and other fungi.

MICOR 9[®] contains spores of nine mycorrhizal species chosen for their compatibility with a variety of plants, high degree of colonization, adaptation to different soils and different environmental conditions. MICOR 9[®] contains 4 strains of Endomycorrhizae (*Glomus* spp.) And 5 strains of Ectomycorrhizae (*Pisolithus* spp., And *Rhizopogon* spp.).
